# CCS Has Full Turing Power

# Fact

CCS can simulate a computation of any Turing machine.

#### Remark

Hence CCS is as expressive as any other programming language but its use is to rather **describe** the behaviour of reactive systems than to perform specific calculations.

# Value Passing CCS

#### Main Idea

Handshake synchronization is extended with the possibility to exchange integer values.

$$\overline{pay(6)}.Nil \mid pay(x).\overline{save(x/2)}.Nil \mid Bank(100)$$

$$\downarrow \tau$$

$$Nil \mid \overline{save(3)}.Nil \mid Bank(100)$$

$$\downarrow \tau$$

$$Nil \mid Nil \mid Bank(103)$$

## Parametrized Process Constants

For example:  $Bank(total) \stackrel{\text{def}}{=} save(x).Bank(total + x).$

# Behavioural Equivalence

#### Implementation

Specification

 $CM \stackrel{\text{def}}{=} coin.\overline{coffee}.CM$   $CS \stackrel{\text{def}}{=} \overline{pub}.\overline{coin}.coffee.CS$ 

 $Spec \stackrel{
m def}{=} \overline{pub}.Spec$ 

# $\textit{Uni} \stackrel{\mathrm{def}}{=} (\textit{CM} \mid \textit{CS}) \setminus \{\textit{coin}, \textit{coffee}\}$

### Question

Are the processes *Uni* and *Spec* behaviorally equivalent?

$$Uni \equiv Spec$$

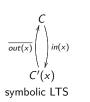

# Translation of Value Passing CCS to Standard CCS

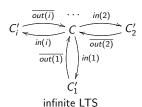

Value Passing CCS

$$C \stackrel{\text{def}}{=} in(x).C'(x)$$
$$C'(x) \stackrel{\text{def}}{=} \overline{out(x)}.C$$

 $C \stackrel{\text{def}}{=} \sum_{i \in \mathbb{N}} in(i).C_i$  $C_i' \stackrel{\text{def}}{=} \overline{out(i)}.C$ 

Standard CCS

3 / 17

emantics and Verification 2006

### Goals

2 / 17

What should a reasonable behavioural equivalence satisfy?

- abstract from states (consider only the behaviour actions)
- abstract from nondeterminism
- abstract from internal behaviour

What else should a reasonable behavioural equivalence satisfy?

- reflexivity  $P \equiv P$  for any process P
- transitivity  $Spec_0 \equiv Spec_1 \equiv Spec_2 \equiv \cdots \equiv Impl$  gives that  $Spec_0 \equiv Impl$
- symmetry  $P \equiv Q$  iff  $Q \equiv P$

Strong Bisimilarity

Let  $(Proc, Act, \{ \stackrel{a}{\longrightarrow} | a \in Act \})$  be an LTS.

# Strong Bisimulation

A binary relation  $R \subseteq Proc \times Proc$  is a **strong bisimulation** iff whenever  $(s,t) \in R$  then for each  $a \in Act$ :

- ullet if  $s \stackrel{a}{\longrightarrow} s'$  then  $t \stackrel{a}{\longrightarrow} t'$  for some t' such that  $(s',t') \in R$
- $\bullet$  if  $t \stackrel{a}{\longrightarrow} t'$  then  $s \stackrel{a}{\longrightarrow} s'$  for some s' such that  $(s',t') \in R$ .

# Strong Bisimilarity

Two processes  $p_1, p_2 \in Proc$  are **strongly bisimilar**  $(p_1 \sim p_2)$  if and only if there exists a strong bisimulation R such that  $(p_1, p_2) \in R$ .

$$\sim = \cup \{R \mid R \text{ is a strong bisimulation}\}$$

## Trace Equivalence

Let  $(Proc, Act, \{ \stackrel{a}{\longrightarrow} | a \in Act \})$  be an LTS.

Trace Set for  $s \in Proc$ 

$$Traces(s) = \{ w \in Act^* \mid \exists s' \in Proc. \ s \xrightarrow{w} s' \}$$

Let  $s \in Proc$  and  $t \in Proc$ .

#### Trace Equivalence

We say that s and t are **trace equivalent**  $(s \equiv_t t)$  if and only if  $\mathit{Traces}(s) = \mathit{Traces}(t)$ 

Lecture 3 (

Semantics and Verification 200

# Basic Properties of Strong Bisimilarity

#### Theorem

7 / 17

~ is an equivalence (reflexive, symmetric and transitive)

#### Theorem

 $\sim$  is the largest strong bisimulation

#### Theorem

 $s \sim t$  if and only if for each  $a \in Act$ :

- if  $s \xrightarrow{a} s'$  then  $t \xrightarrow{a} t'$  for some t' such that  $s' \sim t'$
- ullet if  $t \stackrel{a}{\longrightarrow} t'$  then  $s \stackrel{a}{\longrightarrow} s'$  for some s' such that  $s' \sim t'$

# Black-Box Experiments

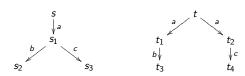

#### Main Idea

8 / 17

Two processes are behaviorally equivalent if and only if an **external observer** cannot tell them apart.

How to Show Nonbisimilarity?

9 / 17

To prove that  $s \nsim t$ :

- Enumerate **all binary relations** and show that none of them at the same time contains (s, t) and is a strong bisimulation. (Expensive:  $2^{|Proc|^2}$  relations.)
- Make certain observations which will enable to disqualify many bisimulation candidates in one step.
- Use game characterization of strong bisimilarity.

Lecture 3 () Semantics and Verification 2006 10 / 17 Lecture 3 () Semantics and Verification 2006 11 / 17 Lecture 3 () Semantics and Verification 2006 12 / 17

# Strong Bisimulation Game

Let  $(Proc, Act, \{ \stackrel{a}{\longrightarrow} | a \in Act \})$  be an LTS and  $s, t \in Proc.$ 

We define a two-player game of an 'attacker' and a 'defender' starting from s and t.

- ullet The game is played in **rounds** and configurations of the game are pairs of states from  $Proc \times Proc$ .
- In every round exactly one configuration is called **current**. Initially the configuration (s, t) is the current one.

#### Intuition

The defender wants the show that s and t are strongly bisimilar while the attacker aims to prove the opposite.

Lecture 3 ()

Semantics and Verification 2006

Strong Bisimilarity is a Congruence for CCS Operations

13 / 17

17

Semantics and Verification 2006

# Other Properties of Strong Bisimilarity

## Theorem

Let P and Q be CCS processes such that  $P \sim Q$ . Then

- $\alpha.P \sim \alpha.Q$  for each action  $\alpha \in Act$
- $P + R \sim Q + R$  and  $R + P \sim R + Q$  for each CCS process R
- ullet  $P \mid R \sim Q \mid R$  and  $R \mid P \sim R \mid Q$  for each CCS process R
- $P[f] \sim Q[f]$  for each relabelling function f
- $P \setminus L \sim Q \setminus L$  for each set of labels L.

### Rules of the Bisimulation Games

### Game Rules

In each round the players change the current configuration as follows:

- ① the attacker chooses one of the processes in the current configuration and makes an  $\xrightarrow{a}$ -move for some  $a \in Act$ , and
- ② the defender must respond by making an  $\stackrel{a}{\longrightarrow}$ -move in the other process under the same action a.

The newly reached pair of processes becomes the current configuration. The game then continues by another round.

#### Result of the Game

- If one player cannot move, the other player wins.
- If the game is infinite, the defender wins.

Lecture 3 ()

Semantics and Verification 200

15 / 17

Following Properties Hold for any CCS Processes P, Q and R

- $P + Q \sim Q + P$
- $\bullet$   $P \mid Q \sim Q \mid P$
- $P + Nil \sim P$
- $P \mid Nil \sim P$

Lecture 3 ()

- $(P+Q)+R\sim P+(Q+R)$
- $(P | Q) | R \sim P | (Q | R)$

#### - C++++

Theorem

• States s and t are strongly bisimilar if and only if the defender has a **universal** winning strategy starting from the configuration (s, t).

Game Characterization of Strong Bisimilarity

 States s and t are not strongly bisimilar if and only if the attacker has a universal winning strategy starting from the configuration (s, t).

#### Remark

Bisimulation game can be used to prove both bisimilarity and nonbisimilarity of two processes. It very often provides elegant arguments for the negative case.
